

Analog Output Linear Hall Sensor

1. Features

- Analog output linear Hall sensor
- Fast power-on start
- Low noise output, no output filtering required
- Single current source output, high bandwidth
- Operating temperature range from -40°C to 105°C
- Responds to both positive and negative magnetic fields
- PKG Type
 - TO-92S(S7)
 - SOT23-3L

2. Applications

- Electric vehicle throttle applications
- Motor control
- Keyboard applications
- Position detection

3. Description

The SC4019 is a linear Hall effect sensor chip whose output voltage is proportional to the supply voltage and the magnetic field strength it senses.

The zero-point output voltage (no magnetic field) of the SC4019 is typically half of the supply voltage, with a typical sensitivity of 2.4mV/Gs at a 5.0V supply voltage and 1.4mV/Gs at a 3.3V supply voltage.

The chip typically operates at 3.3V or 5.0V, with a maximum voltage of 25V. It supports an operating temperature range of -40°C to 105°C, making it suitable for both consumer and industrial applications.

This product is available in 3-pin TO-92S(S7) and SOT23-3L packages. All packages are lead-free with 100% matte tin frame plating.

11. Function Description

Magnetic Field Direction Definition: TO-92S(S7) package, the magnetic field S pole is defined as the positive magnetic field on the chip screen; SOT23-3L(SO) package, the magnetic field S pole is defined as a negative magnetic field on the marking.

Quiescent Output Voltage (V_{OUTQ}): Quiescent Output Voltage indicates the output voltage of the IC when there is no magnetic field.

Sensitivity(S)

$$Sens = [VOUT(B1) - VOUT(B2)] / (B1 - B2)$$

When the South Pole magnetic field perpendicular to the chip tagged side approaches, the output voltage increases proportionally, until it reaches supply voltage. Conversely, when the North Pole magnetic field perpendicular to the chip tagged side approaches, the output voltage decreases proportionally, until it reaches ground level. Sensitivity is defined as the specific value of the output voltage variation and the magnetic field variation, commonly in mV/Gs or mV/mT.

12. Typical Application

Fig.4 Typical Application Circuit

The static (zero field strength) output voltage of the chip, V_Q , is usually half of the power supply voltage in the operating voltage range of the power supply. When the S-pole magnetic field perpendicular to the screen surface of the chip increases, the output voltage of the chip increases proportionally. In contrast, when the N electrode is applied to the silkscreen surface of the chip, the output voltage drops synchronously in the same proportion. The maximum output voltage of the chip at room temperature is $V_{CC}-0.7V$, and the minimum output voltage is $0.8V$, where the linear range is $0.8V \sim V_{CC}-4.2V$.
